# I. Orange Pi Introduction

## 1. What is Orange Pi 2G-IOT?

It's an open-source single-board computer. It can run Android 4.4, Ubuntu, Debian, Raspberry Pi image. It uses the RDA8810 Soc, and has 256MB LPDDR2 SDRAM.

## 2. What can I do with Orange Pi 2G-IOT?

You can use it to build...

- A computer
- A wireless server
- Games
- Music and sounds
- HD video
- A speaker
- Android
- Scratch
- Pretty much anything else, because Orange Pi 2G-IOT is open source.

## 3. Whom is it for?

Orange Pi 2G-IOT is for anyone who wants to create with technology– not just consuming. It's a simple, fun, useful tool and you can use it to take control of the world around you.

## 4. Hardware specification

<b>Hardware specification</b>	
CPU	ARM Cortex-A5 32bit
GPU	Separate graphic processor, Vivante's GC860 support OpenGL ES1.1/2.0 support OpenVG1.4 support DirectFB support GDI/DirecShow 30M Triangle/s, 250M Pixel/s
Memory (SDRAM)	Integrated 256MB LPDDR2 SDRAM
Onboard Storage	TF card / Integrated 500MB 8Bit 1.8V 4K SLC Nand Flash

Onboard WIFI+BT	RDA5991, WIFI+BT
2G model	The four frequency single card GSM/GPRS Dedicated accelerators SIM card
Video Input	A CSI input connector Camera:  Supports 8-bit YUV422 CMOS sensor interface Supports CCIR656 protocol for NTSC and PAL Supports SM pixel camera sensor  Supports video capture solution up to 1080p@30fps
Audio Input	MIC, 3.5 mm Jack
Video Outputs	LCD
Audio Output	3.5 mm Jack、 FM、 SPEAK (Optional)
Power Source	USB OTG input can supply power  Battery input can supply power (Optional)
USB 2.0 Ports	One USB 2.0 HOST, One USB 2.0 OTG
Buttons	Power Button(SW602)
Low-level peripherals	40 Pins Header, compatible with Raspberry Pi B+
GPIO(1x3) pin	UART, ground.
LED	Power led
Supported OS	Android, Ubuntu, Debian, Rasbian
<b>Interface definition</b>	
Product size	67mm × 42mm
Weight	35g
Orange Pi™ is a trademark of the Shenzhen Xunlong Software CO., Limited	

### Top view

### Bottom view

### Interface instructions:

## 5. GPIO Specifications

The CSI Camera Connector is a 24-pin FPC connector which can connect external

camera module with proper signal pin mappings. The pin of CIS connector can be defined as follows. The connector marked with "CON 1" on the Orange Pi 2G-IOT is camera connector.

### OrangePi 2G-IOT-CSI

CON1-P01	NC	
CON1-P02	GND	
CON1-P03	TWI2-SDA	PE13
CON1-P04	VCC-CSI	
CON1-P05	TWI2-SCK	PE12
CON1-P06	CSI-RESET#	PE15
CON1-P07	CSI-VSYNC	PE3
CON1-P08	CSI-STBY-EN	PE15
CON1-P09	CSI-HSYNC	PE2
CON1-P10	VDD1V8-CSI	
CON1-P11	VCC-CSI	
CON1-P12	CSI-D7	PE11
CON1-P13	CSI-MCLK	PE1
CON1-P14	CSI-D6	PE10
CON1-P15	GND	
CON1-P16	CSI-D5	PE9
CON1-P17	CSI-PCLK	PE0
CON1-P18	CSI-D4	PE8
CON1-P19	CSI-D0	PE4
CON1-P20	CSI-D3	PE7
CON1-P21	CSI-D1	PE5
CON1-P22	CSI-D2	PE6
CON1-P23	GND	
CON1-P24	AFVCC-CSI	

## II. Using Method

You can configure your Orange Pi in a very short period of time and use it according to the following steps. You need to fulfill the several steps before booting your Orange Pi.

### 1. Step 1: Prepare Accessories Needed

The first time you use the Orange Pi, you need at least some parts for the following:

No.	Items	Requirements and Instructions
1	TF card	8GB ; class 10 (for now it only supports 8GB SD card).Branded TF cards which are much more reliable are the good choice
2	Power adapter	At lease 5V/2A high quality power adapter, OTG could use as power supply.
3	Keyboard and mouse	Any keyboard and mouse with USB port is applicable; Keyboard and mouse are high-power, so a USB concentrator is required.
4	TTL to USB cable	Support debug log in.
5	Audio cable (Optional)	You can select an audio cable with 3.5mm jack to feel stereo audio.
6	SIM Card (Optional)	Support 2G SIM card

TF card

OTG power adapter

### 2. Step 2: Prepare a TF Card

In order to be able to us Orange Pi normally, you must first install the operating system into the TF card or Nand. The following instructions will teach you how to write the operating system image file to the Windows and Linux Platform. For now this board could support boot from TF card with Android and Linux distro, and could support boot from Nand with Android. It will illustrate about how to write image into Nand.

### 1) Writing image into a SD card on Windows:

- a. Inserting the TF card into the computer, the capacity of the card must be larger than the operating system image, usually requires 8GB or bigger capacity.
- b. Formatting the TF card.
  - i. Download tools for formatting TF card, such as TF Formatter, could be download from [https://www.sdcard.org/downloads/formatter\\_4/eula\\_windows/](https://www.sdcard.org/downloads/formatter_4/eula_windows/)
  - ii. Unzip the downloaded files, and run *setup.exe*
  - iii. In the *options settings* option set the format type option to quick formatting. *Logical size adjustment* option to open "(ON)"

- iv. Make sure the inserted TF card codes are in accordance with the chosen codes.
    - v. Click the "Format" button.
- c. Download the operating system image file from the download page, the page address

is as follows: <http://www.orangepi.cn/downloadresourcescn/>

- d. Unzip the downloaded file (in addition to the Android system, this method can be used to burn to write, the Android system need another burn, the following will introduce).
- e. Right click the downloaded file, select "Unzip file" to write image to TF card.
  - i. Download tools to write image, such as **Win32 Diskimager**, <http://sourceforge.net/projects/win32diskimager/files/Archive/>.
  - ii. Select the path of image file that has been unzipped.

- iii. Click the "Write" button and wait for the image writing.
    - iv. After the image is written, click the "Exit" button.

## 2) Writing image into a SD card on Linux:

- a. Inserting the TF card into the computer, the capacity of the card must be larger than the operating system image, usually requires 8GB or bigger capacity.
- b. Formatting the TF card.
  - i. Run ***fdisk -l*** command to make sure TF disk.
  - ii. Run ***umount /dev/sdxx*** to uninstall all partitions of TF Card.
  - iii. Run ***sudo fdisk /dev/sdx*** command. Use director to delete all partitions of TF Card, and then use ***n*** command to add a new partition, finally use ***w*** command to save and exit.
  - iv. Run ***sudo mkfs.vfat /dev/sdx1*** command to format the TF card partition set up last step to FAT32 form(according to your TF card disk to replace ). Or you could skip this step since command in Linux will format TF card automatic.
- c. Download the image OS from download page:  
<http://www.orangepi.cn/downloadresourcescn/>
- d. Unzip the downloaded file and right click it, select "Unzip file"
- e. Write image into TF card
  - i. Run ***sudo fdisk -l*** command to make sure the TF card disk

ii. Make sure the image file **hash key** is the same as download page offered(optional) :

**sha1sum [path]/[imagename]**

Here will be output some number which should be same as the image page line of "SHA-1"

iii. Run **umount /dev/sdxx** command to uninstall all partitions in TF Card

iv. Run the command of **sudo dd bs=4M if=[path]/[imagename] of=/dev/sdx** to write image file and wait for it finished. You can run **sudo pkill -USR1 -n -x dd** command to check the procedure.

### 3. Step 3: Start your Orange Pi

- Insert the TF card with written image into the TF card slot

- Make sure the toggle switch is showing like the following, booting from SD card.

- Insert the keyboard or mouse into the USB port.
- Connect wifi antenna and base-band antenna

- Connect LCD and Camera

- Connect TTL cable, you could refer to the Debug method in this instruction. Android and Linux use different Baud rate, please note the Baud rate setting. Android Baud rate is 921600, Linux Baud rate is 921600. Serial port uses TTL to USB cable to connect.

- It is the power input interface on the right side for connecting a 5V and at least 2A or bigger than 2A power adapter. Avoid using smaller power GSM mobile phone charger, it is not able to output 2A even if it marked "5V/2A".

If the above steps are successful, the OrangePi will start in a few minutes. The monitor Graphical interface of display system. It may take a long time to start the first

time, please wait patiently. The next time will boot very fast.

#### 4. Step 4: Turn off your Orange Pi correctly

You can use the shutdown button on the interface to safety close the Orange Pi. You can also close the system by entering command in the shell:

```
sudo halt
or
sudo shutdown -h
```

It will be safety to turn off the Orange Pi. If directly use the power button to shut down the system may damage the file system on TF Card. After the system is closed, the power can be cut off by more than 5 seconds' press. If all the above steps run, then your Orange Pi could shut down.

#### 5. Initialize settings for your Linux system

You need to make some basic settings when it is you first time to use Linux on Orange Pi 2G-IOT, like wifi setting, audio setting, user setting.

##### 1) Wifi setting on serial port

In the use of serial login system, enter the login password the system will prompt you to use the OrangePi\_Settings tool to make some basic setting, including wifi setting. You could use the following command in the order line:

```
sudo OrangePi_Settings
> wifi settings
```

This setting include the functions of WIFI statue setting, wifi searching and connect to AP. You could use this method to set wifi.

##### 2) Use ssh to connect wifi

You need to use two cellphones if you want to use this function. Please refer to this: Orange Pi 2G-IOT is defaulted to connect the hotspot of orangepi, the password is orangepi. Use another cellphone's hotspot function, setting the hot spot name as orangepi, password as orangepi. It will connect to orangepi hotspot default after booting the system. After that, use another cellphone to connect the hotspot, and use "wifi assistant" to check the IP of Orange Pi 2G-IOT.

After getting the IP of Orange Pi 2G-IOT, you could use SSH remote login in Linux

PC or Windows PC. Command as following:

```
ssh orangepi@192.168.xxx.xxx
```

Password: orangepi

After enter the system via ssh, run the following command to connect to router:

```
sudo OrangePi_Settings
```

## 6. Write Android into Nand

Orange Pi 2G-IOT is supported boot from Nand, and also supported update Android in Nand.

### 1) Boot Android from NAND

Switching the boot mode into NAND via short jumper cap.

Power it on, Orange Pi 2G-IOT will boot from NAND.

### 2) Update Android in NAND

- Short jumper cap to switch the system to boot from NAND, set toggle switch into 1234 UP, 5678 Down like the following:

### 3) Install writing tool on Windows

For now Nand writing tool could only support working on Windows, you could download the tool from official website: <http://www.orangepi.org/downloadresources/>

### 4) Install USB driver on Windows

Unzip the tool file, install the USB driver, here is the path:  
 \*/OrangePi\_2G-IOT\_Toolschain/USB\_Driver/USB-driver/  
 You should install it according to your PC, if your PC is 32bit, then install x86 USB

driver, if it is 64bit, then is x64 USB driver.

### 5) Download Android Nand image

Here is the link for Orange Pi 2G-IOT Nand version image:

<http://www.orangepi.org/downloadresources/>

### 6) Use writing tool

Use writing tool to write NAND:

`* /OrangePi_2G-IOT_Toolschain/OrangePi_2G-IOT_NandUpdate_Tools/OrangePi_2G-IOT_Update.exe.`

Click “load BIN” to import the image of NAND version into writing tool. After that, click Download button to download the image. Meanwhile, the tool is waiting for the download link of Orange Pi 2G-IOT.

## 7) Download Image

Prepare an Android USB to DC cable, first connect to the OTG port of Orange Pi 2G-IOT, then push on the power button for 5s, and connect the cable to the Windows PC. Meanwhile, the screen will indicate that connect successful and downloading. It will take around 3min to finished downloaded, after that, reboot the system and then the system will run on the update Android.

Note: If it could not download, please check the the shorting cap and switch.

## 7. Android in no screen ADB mode

- ADB setting: Set the toggle switch into 1234 “UP”, 5678 “Down”, the system will switch into adb model, in this model, the USB is unable.

- Connect to the OTG port of Orange Pi 2G-IOT with the USB to DC cable, the other side connect to PC, push the power button and then the system will be Android.
- If the PC haven't set on adb, then please refer to the teaching method of Ubuntu and Windows adb in internet. Use adb command in the PC terminal to connect the adb:  
adb shell
- After connect to OrangePi 2G-IOT via adb, you could refer to the adb debug method from the internet to enter into Orange Pi 2G-IOT

We would recommend you use Plug-in Vysor in Chrome browser, this tool could enter Android via adb:

## 8. Universal software configuration

### 1) Change default account

The default log-in account and password is orangepi/orangepi or root/orangepi. It is recommended to modify the default orangepi account to your own account for secure sake. Take changing into Zhangsan as a sample. Steps are as follows:

- a. Use root account to login Orange Pi
- b. `$ usermod -l zhangsan orangepi`  
Change account of orangepi into Zhangsan

```
@orangepi:~$ usermod -l zhangsan orangepi
```

- c. `$ groupmod -n zhangsan orangepi`  
Change group

```
@orangepi:~$ groupmod -n zhangsan orangepi
```

- d. `$ mv /home/orangepi /home/zhangsan`  
Change directory of original orangepi

```
@orangepi:~$ mv /home/orangepi /home/zhangsan
```

- e. `$ usermod -d /home/orangepi orangepi`  
Set this directory into orangepi user's home directory

```
@orangeypi:~$ usermod -d /home/zhangsan zhangsan
```

f. \$ cat /etc/passwd

It should be shown as following:

```
pulse:x:112:121:PulseAudio daemon,,,:/var/run/pulse:/bin/false
zhangsan:x:1001:1001:orangeypi,,,:/home/zhangsan:/bin/bash
```

After the modification of the above steps, you could use the new account Zhangsan to log in.

## 2) System source configuration

This instruction will take Ubuntu as an example:

a. Open the source file

```
$ sudo vi /etc/apt/sources.list
```

```
root@curry:/home/curry# vim /etc/apt/sources.list
root@curry:/home/curry#
```

b. Edit source file

Replace the source file with your favourite source. Take an example of Ubuntu 16.04 on Zhonkeda source:

```
deb http://mirrors.ustc.edu.cn/ubuntu-ports/ xenial main multiverse
restricted universe
deb http://mirrors.ustc.edu.cn/ubuntu-ports/ xenial-backports main
multiverse restricted universe
deb http://mirrors.ustc.edu.cn/ubuntu-ports/ xenial-proposed main
multiverse restricted universe
deb http://mirrors.ustc.edu.cn/ubuntu-ports/ xenial-security main multiverse
restricted universe
deb http://mirrors.ustc.edu.cn/ubuntu-ports/ xenial-updates main multiverse
restricted universe
deb-src http://mirrors.ustc.edu.cn/ubuntu-ports/ xenial main multiverse
restricted universe
deb-src http://mirrors.ustc.edu.cn/ubuntu-ports/ xenial-backports main
multiverse restricted universe
deb-src http://mirrors.ustc.edu.cn/ubuntu-ports/ xenial-proposed main
multiverse restricted universe
deb-src http://mirrors.ustc.edu.cn/ubuntu-ports/ xenial-security main
multiverse restricted universe
deb-src http://mirrors.ustc.edu.cn/ubuntu-ports/ xenial-updates main
multiverse restricted universe
```

Note: xenial is the version of the code name in this source, if the other version of Ubuntu needs to replace the corresponding version code which can be found on the internet.

### 3) Enter the system via SSH

You could refer to the previous chapter 5. 2)Use SSH to connect Wifi.

### 4) Modify the size of ext4 file system

It could promote system performance via expanding the rootfs partitions of file system after writing image, which could avoid the problems caused by insufficient space.

Expanding rootfs partitions on TF card of PC:

Using GParted to adjust the size:

Select the specified letter, right-click the corresponding letter, select "change the size" to adjust into the desired size, click "adjust the size", close the dialog box and click "apply to all operations", select the "apply" to complete the expansion operation.

#### a. Expand file system

i. Boot to Linux, umount /dev/sdb1 and /dev/sdb2, if it prompts disk busy, then use fuser to clean the using disk(we will recommend using another Linux booting disk to lead the system).

ii. Use fdisk /dev/sdb to adjust the partition size, after into it, enter p, and keep in mind about the initial position of needed extending size partition.

iii. Enter d to delete the partition need to change the size(my file system is /dev/sdb2, which is the 2 partition ).

vi. Enter n to build a new partition, make sure the initial position is the same as you deleted, and enter the number as you desire.

v. Enter w to save the partition data.

vi. Use the following command to check the file system(make sure it is a right file system)

```
e2fsck -f /dev/sdb2
```

vii. Adjust the partition size

```
resize2fs /dev/sdb2
```

viii. It could mount a disk partition, you could check whether it has changed.

#### b. Shrink file system

i. Boot to Linux, umount /dev/sdb1 and /dev/sdb2, if it prompts disk busy, then use fuser to clean the using disk(we will recommend using another Linux booting disk to lead the system).

ii. Use the following command to check the file system(make sure it is a right file system)

```
e2fsck -f /dev/sdb2
```

iii. Modify the size of file system(Use resize2fs)

```
resize2fs /dev/sdb2 900M
```

The "s"after the number represents specifying the size of file system via the sectors(every sector calculated by 512 bite). You could also specify it into K(KB), M(MB), G(GB), etc.

vi. Use fdisk /dev/sdb to adjust the partition size, after into it, enter p, and keep in mind about the initial position of needed extending size partition. You need to

first delete the partition then build a new one because the fdisk could not modify the size dynamic(you need to calculate the size, it have to enough to contain the file system adjusted in last step).

v. Enter d to delete the partition need to change the size(my file system is /dev/sdb2, which is the 2 partition ).

vi. Enter n to build a new partition, make sure the initial position is the same as you deleted, and enter the number as you desire. Besides, if it is boot-able partition you want to change, note that need to keep the boot-able mark in case cannot boot.

The above illustration is using fdisk and resize2fs to modify partition and file system, you could also use gparted. Gparted has graphical interface and it could help you to re-size file system at the same time of re-sizing partition. Goarted is much easier to use and reduce the change to make mistake. For now our official Lubuntu and Raspbian could not use it.

## 9. Use GSM to Connect Network

Orange Pi 2G-IOT Linux Dist has debugged to connect network via GSM. You could first download Linux Dist from official website, Debian, Ubuntu and Raspbian could support GSM function.

First you need to prepare an activated SIM card, the Orange PI 2G-IOT could support the following frequency:

Frequency Range: 850,900,1800,1900

Standard: GSM800

The phone card we used is launched by China Unicom and Alibaba Group.

Download Linux Dist from official website: <http://www.orangepi.org/downloadresources/>

Orange Pi 2G-IoT

 Android Source Code updated:2017-05-11 <a href="#">Download Now</a>	 Linux Source code updated:2017-05-11 <a href="#">Download Now</a>	 Toolschain updated:2017-05-23 <a href="#">Download Now</a>	 User Manual updated:2017-05-17 <a href="#">Download Now</a>

 Debian Server updated:2017-06-06 <a href="#">Download Now</a>	 Android-Nand updated:2017-05-12 <a href="#">Download Now</a>		

Download and write image into SD card, then insert SD card and SIM card into the board.

Execute the following command after power on and login to ppp dial up.  
wvdia Tom &

This command will run at the backstage for dial up, after dial-up access, you could use ping and ifconfig to check the network. If network connect successful, then you could use GSM to connect network.

```

### III. Source Code Compilation of Android and Linux

Hardware: Orange Pi development board\*1, Card reader\*1, TF card\*1, power supply\*1

Software: Linux host computer, which hard disk space at least 50G (to meet a fully compiled need)

Linux host computer needs:

Version 2.7.3 of Python;

Version 3.81-3.82 of GNU Make;

JDK1.6;

Version 1.7 or higher version of Git.

#### 1. Install JDK

- Download and unzip JDK, you will get `jdk-6u31-linux-x64.bin`, copy it to the directory of `/opt`

- Modify the permission of `jdk-6u31-linux-x64.bin` with following command:

```
sudo chmod 755 jdk-6u31-linux-x64.bin
```

- Install `jdk1.6`

```
/jdk-6u31-linux-x64.bin
```

- Configuration multi Java version coexistence mode with the following command:

```
sudo update-alternatives --install /user/bin/java java /opt/jdk1.6.0_31/bin/java 300
```

```
sudo update-alternatives --install /user/bin/javap javap /opt/jdk1.6.0_31/bin/javap 300
```

```
sudo update-alternatives --install /user/bin/javac javac /opt/jdk1.6.0_31/bin/javac 300
```

```
sudo update-alternatives --install /user/bin/jar jar /opt/jdk1.6.0_31/bin/jar 300
```

```
sudo update-alternatives --install /user/bin/javaws javaws /opt/jdk1.6.0_31/bin/javaws 300
```

```
sudo update-alternatives --install /user/bin/javapdoc javadoc /opt/jdk1.6.0_31/bin/javadoc
```

300

- Switch to java version and select version 1.6, use the following command:  

```
sudo update-alternatives --config java
sudo update-alternatives --config javac
sudo update-alternatives --config jar
sudo update-alternatives --config javap
sudo update-alternatives --config javaws
sudo update-alternatives --config javadoc
```
- After confirmed it is version 1.6, you could use the following command:  

```
java -version
```

```
orangePi@OrangePi: /xspace/OpenSource/AthenaCara/H5
orangePi@OrangePi: /xspace/OpenSource/AthenaCara/H5$ java -version
java version "1.6.0_31"
Java(TM) SE Runtime Environment (build 1.6.0_31-b04)
Java HotSpot(TM) 64-Bit Server VM (build 20.6-b01, mixed mode)
orangePi@OrangePi: /xspace/OpenSource/AthenaCara/H5$
```

## 2. Install Platform Supported Software

```
$ sudo apt-get install git gnupg flex bison gperf build-essential \
zip curl libc6-dev libncurses5-dev:i386 x11proto-core-dev \
libx11-dev:i386 libreadline6-dev:i386 libgl1-mesa-glx:i386 \
libgl1-mesa-dev g++-multilib mingw32 tofrodos \
python-markdown libxml2-utils xsltproc zlib1g-dev:i386
$ sudo ln -s /usr/lib/i386-linux-gnu/mesa/libGL.so.1/usr/lib/i386-linux-gnu/libGL.so
```

## 3. Download the Source Package and Unzip it

Download website: <http://www.orangepi.org/downloadresources/>

Downloaded source package and use the following command:

```
$cat OrangePi_2G-IOT* > tar.tar.gz
$ tar -xvzf tar.tar.gz
```

Unzip the file you will get the trunk directory, enter it via the terminal.

## 4. Android source code compiler

Before compiling Android source code, please make sure you have already installed JAVA 1.6 version, if not, please refer to previous charter to install first. After you install java 1.6 successfully, you could begin to compile Android source code.

- Select source code:  
Use command to switch to Android source code:  

```
cd */trunk/
```

- Import development variables  
\$ source build/envsetup.sh
- Select project  
\$ lunch

If boot from TF card, select slt-userdebug, then select NollecA9V2VV8810P\_ext4  
If boot from Nand, select etu-userdebug, then select NollecA9V2VV8810P

- Compile system  
\$ make -j
- Update image if boot from TF card

After compile Android source code for booting from TF card, you will get a new image on the directory of:

`*/trunk/out/target/product/slt**/`

And use the following commands to update it:

```
sudo dd if=bootloader.img of=/dev/sdc bs=512 seek=256 count=4096 && sync
sudo dd if=modem.img of=/dev/sdc bs=512 seek=12544 count=8192 && sync
sudo dd if=boot.img of=/dev/sdc bs=512 seek=20736 count=16384 && sync
sudo dd if=recovery.img of=/dev/sdc bs=512 seek=37120 count=20480 && sync
sudo dd if=system.ext4.img of=/dev/sdc bs=512 seek=57600 count=512000 && sync
sudo dd if=vendor.ext4.img of=/dev/sdc bs=512 seek=569600 count=512000 && sync
```

/dev/sdc is the mounted number on system of SD card.

- Nand update

There will be correspondent image on the directory of `*/trunk/out/target/product/etu**/` after compilation. Update the image into system with NAND update tool. About the details steps you could refer to How to update Android Nand in the manual.

## 5. Compile Linux source Code

Linux source code of Orange Pi 2G-IOT has been updated to github, you could download from github. Compile Linux would require you work under Linux environment. We would recommend you use Ubuntu 16.04 of Linux PC.

- Download Linux source code

You could download Linux source code from github:

<https://github.com/OrangePiLibra/OrangePi>

You could also use git command to update:

```
git clone https://github.com/OrangePiLibra/OrangePi.git
```

- Compile source code

Use the following command to enter into source code directory after you get the source code:

```
cd */OrangePi
```

Execute the following script:

```
./Build_OrangePi.sh
```

Input root password:

After root password recognize successful, enter inter main interface and use Enter key.

Select “Build system with kernel/uboot/rootfs” on main functional interface and use Enter key.

And then select “OrangePi 2G-IOT” with Enter key to update source code.

It would take around 40minutes to update source code and corresponding scripts. After updated the source code, there will be generated a directory of OrangePiRDA. This directory contains both Linux source code and scripts:

- Compile Linux

Execute the following command after enter into directory of OrangePiRDA:

```
./build.sh
```

The script is is an automatic script, you could select a corresponding board which you want to compile, here is “OrangePi 2G-IOT”.

If it is the first time you run the script, the system would install development tool automatic to make sure the network is connecting.

```
orangepi@OrangePi: ~/Tmp/OrangePIRDA
build.sh kernel scripts toolchain
orangepi@OrangePi:~/Tmp/OrangePIRDA$ ./build.sh
orangepi@OrangePi:~/Tmp/OrangePIRDA$ [A
[A: command not found
orangepi@OrangePi:~/Tmp/OrangePIRDA$ ^C
orangepi@OrangePi:~/Tmp/OrangePIRDA$ ^C
orangepi@OrangePi:~/Tmp/OrangePIRDA$ ^C
orangepi@OrangePi:~/Tmp/OrangePIRDA$ ./build.sh
Reading package lists... Done
Building dependency tree
Reading state information... Done
automake is already the newest version.
bc is already the newest version.
gcc is already the newest version.
make is already the newest version.
mtools is already the newest version.
u-boot-tools is already the newest version.
pv is already the newest version.
bsdtar is already the newest version.
The following packages were automatically installed and are no longer required:
ibus-table ibus-table-wubi kde-l10n-engb libtimezonemap1
signon-keyring-extension
Use 'apt-get autoremove' to remove them.
0 upgraded, 0 newly installed, 0 to remove and 211 not upgraded.
```

After installed tool, enter root password and use Enter key.

You will enter into the main interface after entering password, select what you are going to do:

This version is only support the above three options. After selecting the corresponding option, the system would compile automatically.

```

orangepi@OrangePi: /xspace/OrangePi/OpenSource/OrangePiRDA
Compiling Kernel
make: Entering directory '/xspace/OpenSource/GitHubLinux/OrangePiRDA/kernel'
CHK include/generated/uapi/linux/version.h
CHK include/generated/utsrelease.h
make[1]: include/generated/mach-types.h is up to date.
CALL scripts/checksyscalls.sh
CC scripts/mod/devicetable-offsets.s
GEN scripts/mod/devicetable-offsets.h
HOSTCC scripts/mod/file2alias.o
HOSTLD scripts/mod/modpost
CHK include/generated/compile.h
CC init/version.o
LD init/built-in.o
CC kernel/sys.o
CC kernel/module.o
LD kernel/built-in.o

```

There will be prompt the location of kernel image and module after compilation.

```

orangepi@OrangePi: /xspace/OrangePi/OpenSource/OrangePiRDA

OrangePi Build System
-----
Compile finish! kernel path:
/xspace/OrangePi/OpenSource/OrangePiRDA/output/zImage
Module Path:
/xspace/OrangePi/OpenSource/OrangePiRDA/output/lib
<Continue>

```

● Update Linux Kernel and module

After finished the above compilation steps, you could update the new kernel and module into the board to run it. Before this, you could refer to the charter about Linux image writing section to write a Linux distro into SD card. After written image, insert SD card into PC and till now it would recognize there are two partitions, one is boot partition with file of uboot, kernel and Ramdisk. The other partition is rootfs partion which contains root file system.

There is already marked the location of generated kernel, you only need to copy the generated zImage into first partition of SD card and replace zImage inside. Till now the kernel has been updated.

And there is already marked the location of new generated module, the second SD card partition is Rootfs partition, you need to have root permission to delete the directory of rootfs/lib/modules/3.xxx with following command:

```
sudo rm -rf */rootfs/lib/modules/3.xxx
```

Copy the new generated module into rootfs partition you need to use the following command:

```
sudo cp -rf */OrangePiRDA/output/lib/modules/3.xxx */rootfs/lib/modules/ sync
```

After all above steps, kernel and module update have been finished.

You could insert SD card into Orange pi, and make the jumper like the following, after booting, it would enter into Linux.

## IV. Orange Pi Driver development

In order to help developers more familiar with Orange Pi, this instruction will make a brief illustration on device driver module and application program.

Hardware: Orange Pi development board\*1, Card reader\*1, TF card\*1, power supply\*1

### 1. Device driver and application programming

#### 1) Application Program (app.c)

```
#include <stdio.h>
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>
#include <string.h>

int main(int argc, char *argv[])
{
    int cnt, fd;
    char buf[32] = {0};
    if(argc != 2)
    {
        printf("Usage : %s </dev/xxx>\r\n", argv[0]);
        return -1;
    }

    fd = open(argv[1], O_RDWR);
    if(fd < 0)
    {
        printf("APP Error : open device is Failed!\r\n");
        return -1;
    }
    read(fd, buf, sizeof(buf));
    printf("buf = %s\r\n", buf);
    close(fd);
    return 0;
}
```

## 2) Driver Program (OrangePi\_misc.c)

```
#include <linux/kernel.h>
#include <linux/module.h>
#include <linux/fs.h>
#include <linux/miscdevice.h>
#include <linux/init.h>
#include <asm-generic/uaccess.h>

static int orangepi_open(struct inode *inodp, struct file *filp)
{
    return 0;
}

static ssize_t orangepi_read(struct file *filp, char __user *buf, size_t
count, loff_t *offset)
{
    char str[] = "Hello World";
    copy_to_user(buf, str, count);
    return 0;
}

static struct file_operations tOrangePiFops = {
    .owner = THIS_MODULE,
    .open = orangepi_open,
    .read = orangepi_read,
};

static struct miscdevice OrangePi_Misc = {
    .minor = 255,
    .name = "orangepimisc",
    .fops = &tOrangePiFops,
};
```

```
static int __init OrangePi_misc_init(void)
{
    int ret;
    printk("func : %s, line : %d\r\n", __func__, __LINE__);

    ret = misc_register(&OrangePi_Misc);
    if(ret < 0){
        printk("Driver Error : misc_register is Failed!\r\n");
        return -1;
    }
    return 0;
}

static void __exit OrangePi_misc_exit(void)
{
    int ret;
    printk("func : %s, line : %d\r\n", __func__, __LINE__);
    ret = misc_deregister(&OrangePi_Misc);
    if(ret < 0){

        printk("Driver Error : misc_register is Failed\r\n");
    }
}

module_init(OrangePi_misc_init);
module_exit(OrangePi_misc_exit);
```

## 2. Compile device driver

Copy the OrangePi\_misc.c to the \*/trunk/kernel/driver/misc:

Enter to \*/trunk/kernel/driver/misc

Modify Makefile on currently file, shown as following:

```

43 obj-$(CONFIG_SPEAR13XX_PCIE_GADGET) += spear13xx_pcie_gadget.o
44 obj-$(CONFIG_VMWARE_BALLOON) += vmw_balloon.o
45 obj-$(CONFIG_ARM_CHARLCD) += arm-charlcd.o
46 obj-$(CONFIG_PCH_PHUB) += pch_phub.o
47 obj-y += ti-st/
48 obj-$(CONFIG_AB8500_PWM) += ab8500-pwm.o
49 obj-y += lis3lv02d/
50 obj-y += carma/
51 obj-$(CONFIG_USB_SWITCH_FSA9480) += fsa9480.o
52 obj-$(CONFIG_ALTERA_STAPL) +=altera-stapl/
53 obj-$(CONFIG_MAX8997_MUIC) += max8997-muic.o
54 obj-$(CONFIG_WL127X_RFKILL) += wl127x-rfkill.o
55 obj-$(CONFIG_SENSORS_AK8975) += ak8975.o
56 obj-$(CONFIG_SUNXI_VIBRATOR) += sunxi-vibrator.o
57 obj-$(CONFIG_SUNXI_BROM_READ) += sunxi_brom_read.o
58 obj-$(CONFIG_NET) += rf_pm/
59 obj-$(CONFIG_ORANGEPI_MISC) += OrangePi_misc.o

```

Re-modify Makefile

There is Kconfig on the same sibling folders with Makefile. Each Kconfig respectively describes the the source directory file related kernel configuration menu. In the kernel configuration making menuconfig, it read from the Kconfig config menu and the user configuration saved to the config. In the kernel compile, the main Makefile by calling this.Config could know the user's configuration of the kernel.

Kconfig is corresponding to the kernel configuration menu. Add a new driver to the kernel source code, you can modify the Kconfig to increase the configuration menu for your drive, so you can choose whether the menuconfig driver was compiled or not.

```

config SUNXI_BROM_READ
    tristate "Read the BROM infomation"
    depends on ARCH_SUNXI
    default n
    ---help---
    This option can allow program access brom space by the file node.

config ORANGEPI_MISC
    tristate
    default n

```

Modify Kconfig

Back to the source code directory /trunk:

\$ make bootimage

Make sure it have already finished make-engineer-configuration before execute this command, if not, please refer to last section about Linux source code compilation.

Update the new generated module file into Linux system.

It will show on \*cd

/trunk/out/target/product/slt-NollecA9V2VV8810P\_ext4/obj/KERNEL/out/target/product/slt-NollecA9V2VV8810P\_ext4/obj/KERNEL/modules/lib/modules/3.10.62-rel5.0.2/ generated corresponding .ko file, it is the module that generated after OrangePi\_misc.c compilation.

Insert U disk (please note the SD card should have written image) if the SD card is mounted to the directory system of /dev/sdc, then SD card will mount to rootfs, which is /dev/sdc7, and mounted to rootfs partition automatic.

The second partition is the rootfs partition

Copy the directory file:

/trunk/out/target/product/slt-NollecA9V2VV8810P\_ext4/obj/KERNEL/out/target/product/slt-NollecA9V2VV8810P\_ext4/obj/KERNEL/modules/lib/modules/3.10.62-rel5.0.2/ into: /media\*/lib/modules/

### 3. Compiling method of application

Check whether there is the cross compiler, if not, then download and install it.

\$ arm-linux-gnueabi-gcc -v

```
root@curry:/home/curry/lichee# arm-linux-gnueabi-gcc -v
Using built-in specs.

```

Find out the tool for compiling

pwd hows the path and export it into the whole project

```
curry@curry:~/tools/1_arm-linux-gnueabihf-gcc/gcc-linaro-arm-linux-gnueabihf-4.9-2014.07_linux/bin$ pwd
/home/curry/tools/1_arm-linux-gnueabihf-gcc/gcc-linaro-arm-linux-gnueabihf-4.9-2014.07_linux/bin
curry@curry:~/tools/1_arm-linux-gnueabihf-gcc/gcc-linaro-arm-linux-gnueabihf-4.9-2014.07_linux/bin$ vi /etc/environment
```

Indicate the path  
Environment variables

\$ ll /etc/environment shows that the file can only read, need to modify permissions  
\$ chmod 755 /etc/environment

```
root@curry:/home/curry/tools/1_arm-linux-gnueabihf-gcc/gcc-linaro-arm-linux-gnueabihf-4.9-2014.07_linux/bin# ll /etc/environment
-rw-r--r-- 1 root root 151 8月 4 15:24 /etc/environment
root@curry:/home/curry/tools/1_arm-linux-gnueabihf-gcc/gcc-linaro-arm-linux-gnueabihf-4.9-2014.07_linux/bin# chmod 777 /etc/environment
root@curry:/home/curry/tools/1_arm-linux-gnueabihf-gcc/gcc-linaro-arm-linux-gnueabihf-4.9-2014.07_linux/bin# ll /etc/environment
-rwxr-xr-x 1 root root 151 8月 4 15:24 /etc/environment*
```

Only read, needs to modify permission  
Modify permission  
After modified permission

Add the path to the whole environment variable

```
PATH="/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/games:/usr/local/games:/home/curry/tools/opt/FriendlyARM/toolschain/4.5.1/bin:/home/curry/tools/1_arm-linux-gnueabihf-gcc/gcc-linaro-arm-linux-gnueabihf-4.9-2014.07_linux/bin"
```

Add path

Compile the application with cross compiler

\$ arm-linux-gnueabihf-gcc app.c -o aq  
There will be an ap application generated in the directory, copy it to the development board file system(on the rootfs directory of /home/orangepi)  
\$ cp aq /media/\*/home/orangepi/

### 4. Running driver and application

Removed the SD card and inserted it into the development board and power on.

You need to switch to root users and load module driver module to the development board first.

\$ insmod /lib/modules/orangepi.ko

```
orangepi@orangepi:~$ su root ← Switch to super user
Password:
root@orangepi:/home/orangepi# insmod /lib/modules/3.4.39/OrangePi_misc.ko ← Load driver module
```

\$ lsmod To check whether it is loaded

```
root@orangepi:/# lsmod ← Check the loaded module
Module          Size Used by
8189fs           935152 0
OrangePi_misc ← 1315 0 ← Check the character device driver
```

\$ ll /dev/orangepimisc( Miscellaneous equipment automatically generated device files, the specific look at the driver code)

```
root@orangepi:/home/orangepi# ll /dev/orangepimisc ← View details of the character device
crw----- 1 root root 10, 41 Jan 1 1970 /dev/orangepimisc
```

Executive application (note the use of the application, check the code for specify)

\$ ./aq /dev/orangepimisc

## V. Using Debug tools on OrangePi

Hardware: Orange Pi development board\*1, Card reader\*1, TF card\*1, power supply\*1, TTL to USB cable\*1

### TTL to USB cable

### 1. Operations on Windows

In order to get more debugging information in the project development process of using OrangePi, OrangePi default support for serial information debugging. For developers, you can simply get the serial port debugging information with the materials mentioned above. The host computer using different serial debugging tools are similar, basically can reference with the following manual for deployment. There are a lot of debugging tools for Windows platform, the most commonly used tool is putty. This section takes putty as an example to explain the deployment.

Android Baud rate set as 921600

Linux Baud rate set as 921600

### 1) Install USB driver on Windows

- Download and unzip the latest version of driver:  
PL2303\_Prolific\_DriverInstaller\_v130.zip

- Choose application installation as Administrator

- Wait for installation completing

### 2) Install putty on Windows

- Download putty installation package

- Unzip and install it

	636网址导航	2015/5/4 14:21	Internet 快捷方式	1 KB
	putty中文版1.0v	2016/1/20 17:13	应用程序	604 KB

	软件使用说明	2015/5/13 9:23	360 se HTML Do...	1 KB

Click to install

- Open it after installed, shown as below:

### 3) Connect method

Use the TTL to the serial port cable, one end connected to OrangePi, the other end connected to PC

## 4) Equipment information acquisition

- Select *control panel* on *Start* menu

- Click on the *device manager* to check the *port number*

## 5) Putty configuration

Serial port should set to the corresponding port number (COM5), the speed should set to 115200

## 6) Start debug

Power Orange Pi on and boot it, the serial port will automatic print out debug log.

## 2. Operations on Linux

There are Minicom and Kermit serial debugging tools for Linux, this section will take Kermit as an example to have an illustrate.

### 1) Install Kermit

- Install the Kermit by execute command:

```
$ sudo apt-get install ckermit
```

- Configure Kermit

```
$ sudo vi /etc/kermit/kermrc
```

d lines:

```
set line      /dev/ttyUSB1
set speed     115200
set carrier-watch off
set handshake none
set flow-control none
robust
set file type bin
set file name lit
set rec pack  1000
set send pack 1000
set window    5
```

● Add

## 2) Connect method for debug

Use the TTL to the serial port cable, one end connected to OrangePi, the other end connected to PC

## 3) Equipment information acquisition

\$ ls /dev/ (Input command in the PC terminal to check the device number of TTL to the serial cable)

```

root@orange-All-Series: /home/orange
root@orange-All-Series: /home/orange# ls /dev

root@orange-All-Series: /home/orange#

```

Serial number

- It can be seen from the figure that TTL to the serial port cable is identified as ttyUSB0, configure the /ect/kermit/kermitc file, update the serial port information.  
\$ sudo vi /etc/kermit/kermitc
- Set the value of setline into /dev/ttyUSB0
